

[Hands-on Session]

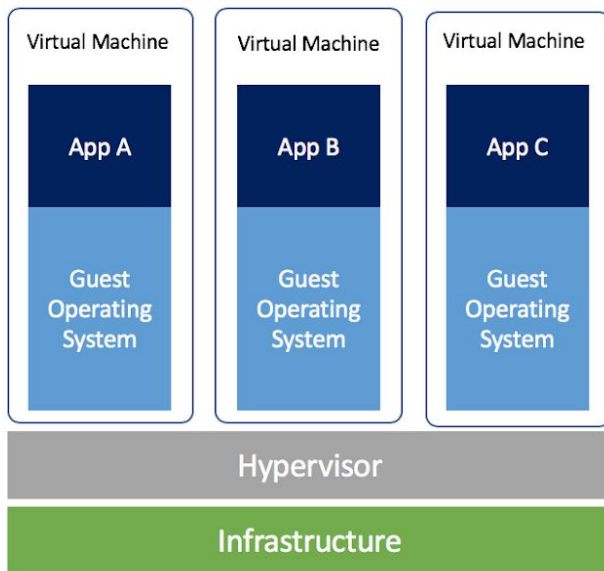

Research Reproducibility

Sang-Yun Oh

Department of Statistics and Applied Probability

Objectives

- Create a VM instance on Google Cloud
- Install Docker
- Launch Jupyter Lab
- Review steps and potential variations

Docker Hub

- Container image registry: <https://hub.docker.com/search>
- Jupyter Lab/Notebook images: <https://hub.docker.com/u/jupyter>
- Variations are explained here:
<https://jupyter-docker-stacks.readthedocs.io/en/latest/using/selecting.html>
- We will use this: <https://hub.docker.com/r/jupyter/scipy-notebook>
- Unique image version tag: jupyter/scipy-notebook:dc57157d6316

Creating VM and Installing Docker Demo

Creating a VM on Google Cloud Platform

- Get \$50 credit here: <https://edu.google.com/programs/students>
- Start here: <https://console.cloud.google.com>

Install Docker and Utilities

- After VM starts, connect using SSH

| Filter VM instances | | | | | | | Columns |
|---|------------|----------------|-----------|-------------------|--------------|---------|---------|
| <input type="checkbox"/> Name ^ | Zone | Recommendation | In use by | Internal IP | External IP | Connect | |
| <input type="checkbox"/>  instance-1 | us-west1-b | | | 10.138.0.2 (nic0) | 34.82.44.223 | SSH | ⋮ |

- Install Docker, Docker-compose, and git:

```
sudo apt-get update && \
```

```
sudo apt-get install git docker.io docker-compose && \
```

```
sudo usermod -aG docker $USER
```

- Exit and reconnect using SSH

- Test Docker installation:

```
docker pull hello-world && docker run hello-world
```

Start Jupyter Docker Image Demo

Start Jupyter Docker Image

- Clone git repository:

```
git clone https://github.com/dddlab/reproducibility-demo && \  
Cd reproducibility-demo && ls
```

- Install wget and run setup.sh:

```
sudo apt-get install -y wget && ./setup.sh
```

- Run docker-compose:

```
IMAGE=first-env docker-compose up --build
```

Setup Firewall Rules (Google Cloud Console)

- Name: jupyterlab (or some other name)
- Targets: All instances in the network
- Source IP ranges: 0.0.0.0/0
- Protocols and ports:
check "tcp" and type "8888, 8889"

Action on match ?

☒ Allow

☐ Deny

Targets

All instances in the network

Source filter

IP ranges

Source IP ranges *

0.0.0.0/0 ✕ for example, 0.0.0.0/0, 192.168.2.0/24

Second source filter

None

Protocols and ports ?

☐ Allow all

☒ Specified protocols and ports

☒ tcp :

8888,8889

Connect to your VM instance

- Note the External IP address of your VM:

| Filter VM instances | | | | | | | Columns |
|---|------------|----------------|-----------|-------------------|--------------|---------|---------|
| <input type="checkbox"/> Name ^ | Zone | Recommendation | In use by | Internal IP | External IP | Connect | |
| <input type="checkbox"/>  instance-1 | us-west1-b | | | 10.138.0.2 (nic0) | 34.82.44.223 | SSH | ⋮ |

- Open a browser and enter as URL (including https):
`https://[External IP]:8889`
- Congratulations!
You successfully launched Jupyter Lab environment on the Cloud

Binder Compatibility Demo

Binder

- <https://mybinder.org>
- Creates computational environment from reproducible sources: e.g. GitHub, Gist, GitLab.com, Zenodo DOI, Figshare DOI, Dataverse DOI
- Minimal example repository:
<https://github.com/binder-examples/jupyter-stacks>
- Let's make our repository compatible with Binder

Modifications

- Dockerfile
 - (Binder only) Add compatibility for Binder session
 - (Binder only) Copy repository content to ``/home/jovyan/work``
 - Install ``cvxpy`` module
- Docker-compose.yml
 - Only used for starting Jupyter notebook on VM (Google Cloud)
 - Mount repository directory to ``/home/jovyan/work`` inside container
